

Welcome! We're excited to see what you can do. Our aim is for you to have fun while demonstrating your coding skills, interpretation of requirements, and ability to communicate ideas effectively. Plan for no more than 1-2 working sessions to complete this.

Tools & AI Usage Use whatever open-source libraries, tools, and AI assistants you'd like. We work with these tools every day and don't expect you to work without them. Please document what you used and briefly explain your choices -- "this is what I know" is a totally acceptable answer.

That said, only use what you actually know. We've seen candidates try to learn a new framework or language for the takehome and while we admire the enthusiasm, it rarely goes well. You'll spend your time fighting the tools instead of solving the problem, and it shows in the review session. Stick with what you're comfortable with.

Live Review Session You're welcome to use AI during the live session too. How you use it is part of what we're evaluating. Strong candidates read the problem carefully, ask clarifying questions, and verify what AI produces rather than just accepting it. We will dig into your implementation, so make sure you understand what you built and why.

A useful gut check: could you roughly recreate this, or explain why it works, if asked? If yes, you're in good shape.

During the session we'll also ask you to add something new to your app live. We won't tell you what in advance -- design and build with that in mind.

Submission Include a Loom walkthrough (under 10 minutes) covering a demo, your key architecture decisions, and one decision you're not fully satisfied with and would do differently with more time. Ensure your solution is well-documented and easily runnable.

We're here if you have questions. Good luck and enjoy!
